

## SAS coding

The goal of the project is to automate the benchmarking of ASVAB scores in a Tableau dashboard. We are still early in the project so we're still gathering information on the requirements from the client. But at a general level, we're looking for someone who can write SAS code to automate the process of cleaning and restructuring many (140+) datasets into one file that can be fed into Tableau. This will involve not only developing the process for cleaning and integrating the raw data, but also documenting the process so it can be applied to all raw data in the future. That is, we'd want the code to be well-documented with comments in the code and an accompanying user-friendly handbook so the client can update, troubleshoot, and edit the code as needed.

If you know of someone who might have the SAS expertise to support this work, please have them reach out to me.
